

How to Configure AWS Polly Text-To-Speech Service?

Last Updated : 09 Dec, 2024

Amazon Polly is a cloud-based service that utilizes deep learning techniques to transform written text into realistic speech. By incorporating into their applications developers can effortlessly integrate speech synthesis providing accessibility to more engaging user experiences and personalized interactions. In today's era, the use of text-to-speech (TTS) has become essential in different applications. It greatly enhances user experiences, with multimedia content. Makes accessibility easier. Amazon Polly, a service provided by Amazon Web Services (AWS) is a TTS solution that utilizes advanced deep-learning technologies to convert text into speech. This article aims to simplify and provide an explanation of how to set up AWS Polly.

AWS Polly Text-To-Speech Service Components

- **Text-To-Speech:** Process of converting text input to realistic speech by using advanced deep learning technologies.
- **Voice:** Polly offers many kinds of voices. The voices have different accents, languages, and ways of talking. Each voice has a name like Joanna or Matthew. They are categorized based on gender, language, and region.
- **Speech Synthesis Markup Language (SSML):** SSML allows users to control how Polly talks, like pronunciation, tone of voice, and speaking speed. It lets you make small changes to how Polly turns text into speech.
- **Lexicons:** Custom pronunciation dictionaries that allow users to specify the pronunciation of specific words or phrases especially if the words are not correctly pronounced by default.

Step 5: Integrate AWS Polly Into Your Application

- Use AWS SDK or [API](#) to integrate Polly into your application code.
- First you need to install AWS SDK. AWS SDK supports various programming languages including [Java](#) , [Python](#), [Java Script](#), (Node.js), [Ruby](#).

- Initialize an instance of Polly client in your application code using the AWS SDK. Use Polly client to synthesize speech from text. Polly supports several languages and voices.

Here is the basic example in Python using AWS SDK

```
import boto3

# Initialize Polly client
polly_client = boto3.client('polly', region_name='us-east-1') #
Corrected AWS region

# Synthesize speech
response = polly_client.synthesize_speech(
    Text='Hello, this is a sample text.',
    OutputFormat='mp3',
    VoiceId='Joanna' # Specify voice to use
)

# Save synthesized audio to a file
with open('output.mp3', 'wb') as file:
    file.write(response['AudioStream'].read())
```

Conclusion

Setting up Amazon Polly to enable text, to speech synthesis is a procedure that gives developers the ability to enhance their applications with speech. By following the instructions provided in this article and utilizing the frequently asked questions (FAQs) provided, you can seamlessly integrate Polly into your projects. Provide users with engaging experiences.

AWS Polly Service - FAQs

Can I Use Amazon Polly For Commercial Projects?
